Predatory journals have a significant impact on researchers in developing countries. These journals often target researchers from countries with limited resources who are looking to publish their work and gain recognition in their field. Predatory publishers often use deceptive practices to lure these researchers into submitting their work, such as falsely claiming to have a rigorous peer-review process or promising quick publication times [1].

For researchers in developing countries, publishing in predatory journals can have significant negative consequences. These journals are often not recognized or respected by the academic community, leading to a lack of credibility for the author and their work. In addition, the high publication fees charged by predatory journals can be a significant burden for researchers from countries with limited resources [2]. This can lead to a situation where researchers are paying to have their work published in low-quality journals, rather than investing in reputable publications that could advance their careers and contribute to the broader scientific community.

Another issue with predatory journals in developing countries is the potential for exploitation by Western researchers or institutions. Some researchers or institutions may use predatory journals to publish low-quality research in developing countries, in order to meet publication quotas or to fulfill grant requirements [3]. This can further damage the reputation of researchers and institutions in developing countries, and perpetuate a cycle of exploitation and inequality in the academic publishing industry.

To address the issue of predatory journals in developing countries, it is important to increase awareness of the risks associated with these publications. This includes providing education and training on how to identify predatory journals and avoid soliciting emails, as well as promoting the use of reputable journals and publishers. It is also important to address the root causes of the problem, such as limited resources and lack of access to reputable publishing outlets, by increasing funding for research and promoting collaboration and partnership between researchers and institutions in developed and developing countries [4,5].

In conclusion, predatory journals have a significant impact on researchers in developing countries, and addressing this issue requires a concerted effort from the academic community. By promoting awareness of the risks associated with predatory journals and investing in reputable publishing outlets, we can help to mitigate the negative consequences of these publications and support the advancement of research in developing countries.
